

cv-cat view: an issue of running multiple instance of it

Recently, we found that **cv-cat view** stopped working properly, when used several times in the same **cv-cat** call.

Something like

```
> cat images.bin | cv-cat "view;invert;view;null"
```

would either crash or behave in undefined way. All our debugging has pointed to some sort of race condition in the underlying **cv::imshow()** call or deeper in X-windows-related stuff, thus, at the moment, it seems to be out of our control.

Use the following instead:

```
> cat images.bin | cv-cat "view;invert" | cv-cat "view;null"
```
