

points-join: output more than one nearest point

When joining two point clouds, if you would like to output a few nearest points, now you can use **points-join** with **--size** option:

```
> # single nearest point (same as before):  
> echo 0,0,0 | points-join <( echo 0,0,1; echo 0,0,2; echo 0,0,3 ) --radius 5  
0,0,0,0,0,1  
> # up to a given number of nearest points:  
> echo 0,0,0 | points-join <( echo 0,0,1; echo 0,0,2; echo 0,0,3 ) --radius 5 --size 2  
0,0,0,0,0,1  
0,0,0,0,0,2
```
